A case is described in which a new type of small electro-magnet was used to extract a bent nail from the right main bronchus. The magnet was fixed, like the olive of a duodenal catheter, to the end of a rubber tube which was inserted into the bronchial tree under indirect laryngoscopic control. The further progress of the magnet was directed via the fluoroscopic screen. The foreign body was rapidly and safely extracted without the aid of an endoscopic tube.

50. ĐURIŠKA J. Otolaryngol. Odd. OÚNZ v Ružomberku. \*Intrakutánná krcná novokainová blokáda podľa Hatnera v chirurgii palatálnych tonzíl. Ratner's intradermal cervical novocaine blocking in surgery of the palatine tonsils BRATISLAVSKE LEKÁRSK. LISTY 1956, 36/6 (472-479)

On the basis of experience of 146 bilateral tonsillectomies the author states that the anaesthetic effect of intradermal blocking is not equivalent to oral anaesthesia. It is possible to perform tonsillectomies under this anaesthesia. During operation there is a larger tissue bleeding and the preparation is more difficult than in infiltration anaesthesia. The postoperative wounds, however, are better; they heal faster than those following oral infiltration anaesthetics. According to the author the blocking is suitable for the treatment of sore throat, acute peritonsillitis, and further as anaesthesia in tonsillectomy 'à chaud', 'à tiède', and in incisions of peritonsillar abscesses.

Prace Komisji Polityki i Ekonomii Węgla  
Tom 10, Nr 1, 1954, pp. 100-109

The activity of the semi cake is determined by the amount of gas evolved from certain indigenous brown coals. The activity of the semi cake was measured on the measurement of the heat effect of the reaction of semi-cake and hydrogen peroxide. The addition of iron salts increases the activity of semi-cake. The activity of semi-cake is determined by the amount of gas evolved from the semi-cake. The activity of semi-cake is determined by the amount of gas evolved from the semi-cake. The activity of semi-cake is determined by the amount of gas evolved from the semi-cake.

TITLE : The Mite Tetranychus atlanticus, A Grain  
Crop Pest in Vojvodina in 1956.

ORIG. PUB.: Zashchita bilja, 1956, 38, 67-70

ABSTRACT : The mite T. atlanticus which appeared in  
1954 in the north-eastern part of Yugoslavia  
causes the greatest harm to corn and rye. The  
numbers of mites rose abruptly in 1956 in  
connection with the dry summer. Chemical con-  
trol was not applied for fear of exterminat-  
ing predators of this mite. -- From the  
author's summary

AUTHORS: Spasió, M., Durković, B.

TITLE: Behavior of germanium in pyrometallurgical processing of concentrates at the Bor Plant (Yugoslavia)

PERIODICAL: Referativnyy zhurnal, Metallurgiya, no. 5, 1962, 17, abstract 5G104 ("Technika", 1961, v. 16, no. 10, "Rud. i. metalurg." v. 12, no. 10, 230 - 233, Serbo-Croatian; German summary)

TEXT: The authors investigated the possibility of transferring a major portion of Ge into dust when roasting Cu-concentrates by maintaining simultaneously the desulfurization required. Ge transition into dust to 40 - 50% was successfully performed at the laboratory by roasting the concentrate mixed with 10 - 15% carbon dust without considerable air excess at 850 - 900°C; desulfurization could be regulated within the desirable limits up to 80%.

A. Tseydler

TITLE: Concentrating germanium contained in a powder agglomerate

PERIODICAL: Referativnyy zhurnal. Khimiya, no. 10, 1962, 397, abstract  
10K56 (Glasnik Khem. drushtva, v. 23-24, nos. 7-10,  
1958-1959, 539-549)

TEXT: An agglomerate (chemical composition in % : Ge 0.05; Cu 6.80;  
As 25.40; Fe 15.50; S 18.3;  $SO_4^{2-}$  22.8;  $Al_2O_3$  0.35;  $SiO_2$  0.65;  
CaO 0.42;  $H_2O$  3.05; granulometric composition: fraction 10-50 mesh 47.8%,  
fraction 60-100 mesh 51.5%, < 100 mesh 1.5%) was extracted by means of hot  
and cold water and weak aqueous solutions of  $H_2SO_4$ . Experiments were  
conducted in the separation of the germanium by cementation with powdered  
zinc, precipitation with sulfides and with tannin solutions. It is best  
separated by tannin; ~25 g tannin per 1 g germanium is required in  
the solution; the precipitating complex contains (in %) : Ge 2.43-5.0;

\*Complex treatment of cancer of the lower lip ČSL. ONKOL.  
1956, 3/3 (251-259) Tables 4

A study has been made by the authors of cases of cancer of the lower lip from 1946-1954. Treatment can either be by radiation or surgery. Radiation was used either by superficial, medium or deep X-rays, radium mould, radium needle implants or radon seeds. The authors state that surgery is being used much less now except for glandular metastases and recurrences after irradiation. Where the gland metastases are inoperable, radiation therapy is used. Surgery of the glands may or may not be combined with surgery of the primary lesion; upper neck dissection usually suffices. Prophylactic irradiation is not generally recommended, nor is prophylactic surgical removal of glands, but opinions vary considerably. 192 cases are analysed. Most are men, and most show squamous carcinoma. Ninety-four were treated with radium, 32 with superficial irradiation. An 89% cure rate is claimed. Twenty-one had combined surgical and irradiation treatment, with an 81% cure rate. Seventeen had surgery only with 40% cure. Deep irradiation was given to 16 patients. Total survival figures are 81%.

 Title : The Influence of Betamercaptoethylamine on Irradiated BS Tumors in Rats  
 Orig. Pub. : Neoplasma, 1957, 4, No 4, 345-350  
 Abstract : It is known that beta-mercaptoethylamine (EM) is an effective agent protecting the animal organism from the action of ionizing radiation. EM is used in the treatment of radiation sickness. In connection with this, a question was raised as to the possibility of a decreased effect of roentgen therapy of tumors after the use of EM. The experiments were performed on rats of the Wistar strain to which malignant hamartomas (BS tumor) were grafted subcutaneously. A few minutes

Abstract : prior to a close distance irradiation of the tumor (250 r. per min., total dose 10,000 r.), BM was administered intraperitoneally in a dose of 2.06 mg./kg., which equals  $2/3$   $LD_{50}$  for mice. Rapid absorption of BM provided its maximum effect during irradiation. This was manifested by a 50% decrease in the number of animals with complete regression of the tumor and in earlier recurrence of relapses in the cases with partial regression. However, the authors believe that

A personal method of sieve therapy is described and 42 cases of cancer in various stages, treated with this method, are analysed. In the advanced stages of cancer no significant effectiveness was observed. For the future, suitable cases should be selected and the problem of dosage dealt with to evaluate the therapeutic value of sieve irradiation.

4298. **Clinical application of cysteamine in radiation disease** Klinische Applikation von Cysteamin bei der Strahlungskrankheit. DURKOVSKY J. and SIRACKA-VESELA E. Onkol. Forsch. Inst., Bratislava *Neoplasma* 1958, 5/4 (417-423) Tables 4  
A detailed analysis is presented of the causation of radiation disease in 42 subjects with malignant tumours treated with deep X-ray therapy. In order to combat the condition,  $\beta$ -mercapto-ethylamine (cysteamine) was used, with very good results. This substance had the best therapeutic effect if it was administered immediately before the irradiation.
